

Abstract

Executive Summary of the CreditGuard AI System

Author: Shaik Mahammad Shariff

Abstract

This project presents CreditGuard AI, an end-to-end supervised machine learning platform designed to automate credit card risk assessment and automate card approvals. Using a dataset consisting of applicant demographics and monthly payment records, the system maps default delinquency risk (≥ 60 days delinquent status) and deploys a lightweight, production-grade Flask REST server. The system prioritized Recall to safeguard financial resources from credit default and successfully generalized under severe class imbalance.
