

Brainstorming Document

1. Core Credit Scoring Dilemma

Automating credit risk evaluation represents a critical bottleneck for modern retail banks. Standard manual checks are slow and prone to subjective human biases. CreditGuard AI aims to resolve this operational delay by deploying stateless scikit-learn models coupled with local explanation attributions (LIME).

2. Prioritized Project Objectives

- High recall models to minimize default risks.
- Transparent explanations of every approve/reject outcome to stay compliant with fair credit reporting standards.
- Futuristic responsive web dashboard analytics for risk appraisers and administrators.
