

Brainstorming & Idea Prioritization

1. Project Brainstorming Overview

The CreditGuard AI platform is built as an automated solution for predicting credit card approvals and default risk levels. During the ideation phase, various feature requirements and user dashboard configurations were brainstormed by stakeholders:

- Real-time Machine Learning models to score applicants based on standard income/debt parameters.
- Interactive multi-step application wizard forms to reduce user cognitive load.
- Local explainability attributions using LIME-inspired Ridge surrogate coefficients to provide explainable AI justifications.
- Secure role-based user authentication (Administrator, Loan Officer, Client User).

2. Prioritization Matrix

To deliver a state-of-the-art solution, ideas were prioritized based on feasibility, business impact, and complexity:

Feature Idea	Impact	Complexity	Priority
ML Scoring Pipeline	Critical	Medium	High
LIME Explainable AI	High	High	High
Role-Based Sessions	High	Medium	High
PDF QR Verification	Medium	Medium	Medium
Supabase Cloud Sync	Medium	High	Low
